Dynamic Models in Biology By Stephen P. Ellner, John Guckenheimer

From controlling disease outbreaks to predicting heart attacks, dynamic models are increasingly crucial for understanding biological processes. Many universities are starting undergraduate programs in computational biology to introduce students to this rapidly growing field. In *Dynamic Models in Biology*, the first text on dynamic models specifically written for undergraduate students in the biological sciences, ecologist Stephen Ellner and mathematician John Guckenheimer teach students how to understand, build, and use dynamic models in biology.

Developed from a course taught by Ellner and Guckenheimer at Cornell University, the book is organized around biological applications, with mathematics and computing developed through case studies at the molecular, cellular, and population levels. The authors cover both simple analytic models--the sort usually found in mathematical biology texts--and the complex computational models now used by both biologists and mathematicians.

Linked to a Web site with computer-lab materials and exercises, *Dynamic Models in Biology* is a major new introduction to dynamic models for students in the biological sciences, mathematics, and engineering.

Editorial Review

Review

"What is remarkable about *Dynamic Models in Biology* is that it truly speaks to students of biological sciences. It puts biology first, and then tries to explain how mathematical tools can explain biological phenomena. Nothing else I've seen does this anywhere near as well. The authors have combined their experience to produce an excellent textbook."--**Bill Satzer, *MAA Reviews***

"This is a great book and I expect that it will play an important role in the teaching of mathematical biology and the development of the next generation of mathematical biologists for many years to come."--**Marc Mangel, *SIAM Review***

"*Dynamic Models in Biology* stands apart from existing textbooks in mathematical biology largely because of its interdisciplinary approach and its hands-on, project-oriented case studies and computer laboratories. In an effort to explore biology in more detail, the authors bravely chose a style that differs from the classical biomath texts . . . whose focus is more on formal mathematics."--**Lewi Stone, *BioScience***

"The book begins with a stellar overview of the purpose of modeling, contrasting statistical with dynamical models, and theoretical with practical models both clearly and even-handedly...[E]ngaging the full breadth and depth of this book could be an education for both instructors and students alike."--**Frederick R. Adler, *Mathematical Biosciences***

"[S]tudents from both biology and mathematics can gain much from this book. *Dynamic Models in Biology* would be appropriate for use in a semester or two-quarter course; however, with judicious selection of topics, it can be used in a quarter. My students included undergraduates in biology with knowledge only of calculus, undergraduates in mathematics, and graduate students and academic staff in biology, all enrolled on a ten-week course. . . . Overall, *Dynamic Models in Biology* fills an important niche in the biological modeling canon. It occupies a place on my shelf next to Edelstein-Keshet (1988) and Murray (1989), and like them, will become a well-thumbed reference."--**Carole L. Hom, *Environmental Conservation***

From the Back Cover

"This book is written with the reality of biology students and their apprehension about mathematics in mind. The applications of mathematical models to real biological problems are not contrived, as they are in a number of other texts. And the biology examples are taken from the current literature--a wonderful help to those who will be teaching with this book."--**Jim Keener, University of Utah, author of *Principles of Applied Mathematics and Mathematical Physiology***

"*Dynamic Models in Biology* is a new and significant contribution to the field. Very well written and clearly presented, it fulfills its goal of bringing dynamic models into the undergraduate biology curriculum. Indeed it puts biology first, and then seeks to show how biological phenomena can be explained in mathematical terms."--**Martin Henry H. Stevens, Miami University**

"This excellent book is a major contribution to the literature. Strong biologically and mathematically, well-organized, and engagingly written, it introduces the subject of dynamical models in biology in as coherent a way as I have seen anywhere. Few authors could approach this topic as authoritatively as do Ellner and

Guckenheimer."--**Simon Levin, Princeton University, author of *The Importance of Species* and *The Encyclopedia of Biodiversity***

About the Author

Stephen P. Ellner is Professor of Ecology and Evolutionary Biology at Cornell University. He has published numerous papers on subjects from measles epidemics to bumblebee behavior, in publications including "Science" and "Nature". John Guckenheimer is Professor of Mathematics at Cornell University. He is the coauthor of "Nonlinear Oscillations, Dynamical Systems, and Bifurcations of Vector Fields".

Users Review

From reader reviews:

Lottie Jowers:

Reading a guide can be one of a lot of action that everyone in the world enjoys. Do you like reading book therefore. There are a lot of reasons why people enjoyed. First reading a book will give you a lot of new information. When you read a e-book you will get new information mainly because book is one of many ways to share the information or their idea. Second, reading through a book will make you more imaginative. When you reading through a book especially tale fantasy book the author will bring someone to imagine the story how the characters do it anything. Third, it is possible to share your knowledge to other people. When you read this Dynamic Models in Biology, it is possible to tells your family, friends and soon about yours publication. Your knowledge can inspire the mediocre, make them reading a book.

Lewis Skinner:

Do you really one of the book lovers? If yes, do you ever feeling doubt if you are in the book store? Try and pick one book that you never know the inside because don't assess book by its protect may doesn't work is difficult job because you are frightened that the inside maybe not while fantastic as in the outside appear likes. Maybe you answer is usually Dynamic Models in Biology why because the great cover that make you consider about the content will not disappoint anyone. The inside or content is definitely fantastic as the outside or perhaps cover. Your reading sixth sense will directly direct you to pick up this book.

Richard Byrnes:

The book untitled Dynamic Models in Biology contain a lot of information on it. The writer explains the girl idea with easy technique. The language is very easy to understand all the people, so do definitely not worry, you can easy to read the item. The book was published by famous author. The author brings you in the new period of literary works. You can easily read this book because you can please read on your smart phone, or model, so you can read the book within anywhere and anytime. If you want to buy the e-book, you can wide open their official web-site and order it. Have a nice go through.

Jesus Brewster:

What is your hobby? Have you heard in which question when you got scholars? We believe that that query

was given by teacher with their students. Many kinds of hobby, All people has different hobby. And you know that little person similar to reading or as reading become their hobby. You have to know that reading is very important and also book as to be the point. Book is important thing to include you knowledge, except your own teacher or lecturer. You find good news or update regarding something by book. Amount types of books that can you choose to use be your object. One of them is this Dynamic Models in Biology.
