A Short Course on Spectral Theory (Graduate Texts in Mathematics) By William Arveson

This book presents the basic tools of modern analysis within the context of the fundamental problem of operator theory: to calculate spectra of specific operators on infinite dimensional spaces, especially operators on Hilbert spaces. The tools are diverse, and they provide the basis for more refined methods that allow one to approach problems that go well beyond the computation of spectra: the mathematical foundations of quantum physics, noncommutative K-theory, and the classification of simple C*-algebras being three areas of current research activity which require mastery of the material presented here.

From the reviews:

MATHEMATICAL REVIEWS

"This book, a product of the author's own graduate courses on spectral theory, offers readers an expert and informed treatment of the major aspects of the spectral theory of Hilbert space operators. It is evident that a great deal of thought has gone into the choice of topics, the presentation of the results, and the design of exercises. The text is clearly written and the material is motivated in a fashion that a newcomer to the subject can readily understand... Graduate students and experienced mathematicians alike will enjoy and benefit from a close reading of this well-written book."

"I find that Arvesen's book is a fine addition to the existing literature. Each section has several interesting, doable exercises. Arvesen tells us that the book is based on graduate courses taught at Berkeley to first and second year PhD students. In Europe, it should be possible to teach parts of the book (e.g. chapters 1 and 3) to students at the Master level." (Alain Valette, Bulletin of the Belgian Mathematical Society, Vol. 12 (1), 2005)

"The book is written in an easily readable style, the composition is clear, many examples and a great number of exercises help the reader in understanding the material." (Endre Durszt, Acta Scientiarum Mathematicarum, Vol. 69, 2003)

"This book ... offers readers an expert and informed treatment of the major aspects of the spectral theory of Hilbert space operators. It is evident that a great deal of thought has gone into the choice of topics, the presentation of the results, and the design of exercises. The text is clearly written and the material is motivated in a fashion that newcomers to the subject can readily understand. ... Graduate students and experienced mathematicians alike will enjoy and benefit from ... this well-written book." (Douglas R. Farenick, Mathematical Reviews, Issue 2001 j)

"I used (part of) the book last year for a small class ... at UNSW, and it eased the task of writing the lectures considerably. ... This is very much a book written for students. There are lots of nice examples and informative exercises. ... I was quite struck by the number of places where the writing provided me with new insights. ... this book is highly recommended for anyone ... who wants to acquire some of the basic tools of modern analysis." (Ian Doust, The Australian Mathematical Society Gazette, Vol. 30 (3), 2003)

"The aim of the present book ... is to make the reader acquainted with the basic results in spectral theory, needed for the study of more advanced topics The book is a clear, short and thorough introduction to spectral theory, accessible to first and or second year graduate students. As the author points out in the Preface: 'this material is the essential beginning for any serious student in modern analysis'." (S. Cobzas, Studia Universitatis Babes-Bolyai Mathematica, Vol. XLVII (4), 2002)

"In this book the basic tools of modern operator theory are presented. The notion of a spectrum of an operator is treated with the more abstract notion of spectrum of an element of a complex Banach algebra. ... Each part of the book contains interesting exercises, which give many new insights into further

developments and enhance the usefulness of the book." (F. Haslinger, Monatshefte für Mathematik, Vol. 138 (3), 2003)

"The book is well-written and provides a large variety of results, ranging from the historical roots to the frontiers of contemporary research. ... the book may be of interest for those who have already got in touch with classical spectral theory during a course on functional analysis and operator theory, and want to learn something about the interconnections of spectra with abstract fields like C^* -algebras or modern K -theory." (Jürgen Appell, Zentralblatt MATH, Vol. 997 (22), 2002)

"This is a nicely written textbook which can be recommended to every student of modern analysis. The text, already lively, additionally gains through a lot of exposed Remarks. Further, any section contains a lot of Exercises (together nearly 175) ... for which sometimes hints are given." (J. Synnatzschke, Zeitschrift für Analysis und ihre Anwendungen, Vol. 21 (2), 2002)

"Presents a tightly structured whole, fitted into an orbit of around 130 pages, and provides the reader with 'many deep and important ideas [that] emerge in natural ways.' ... Little more needs to be said about this excellent book: it has plenty of good exercises, it is well written, and reaps the benefit of coming from the author's experience with this important material in his graduate courses at Berkeley. It is indeed a very good textbook in a fundamental and centrally important subject." (Michael Berg, The Mathematical Association of America, May, 2012)

From the Back Cover

This book presents the basic tools of modern analysis within the context of the fundamental problem of operator theory: to calculate spectra of specific operators on infinite dimensional spaces, especially operators on Hilbert spaces. The tools are diverse, and they provide the basis for more refined methods that allow one to approach problems that go well beyond the computation of spectra: the mathematical foundations of quantum physics, noncommutative k -theory, and the classification of simple C^* -algebras being three areas of current research activity which require mastery of the material presented here. The book is based on a fifteen-week course which the author offered to first or second year graduate students with a foundation in measure theory and elementary functional analysis.

From reader reviews:

Ryan Mendoza:

As people who live in the modest era should be update about what going on or info even knowledge to make all of them keep up with the era and that is always change and make progress. Some of you maybe will update themselves by examining books. It is a good choice to suit your needs but the problems coming to you actually is you don't know what one you should start with. This A Short Course on Spectral Theory (Graduate Texts in Mathematics) is our recommendation to make you keep up with the world. Why, because this book serves what you want and wish in this era.

Clarence Guyer:

Now a day people who Living in the era just where everything reachable by connect with the internet and the resources included can be true or not require people to be aware of each facts they get. How individuals to be

smart in receiving any information nowadays? Of course the solution is reading a book. Reading through a book can help persons out of this uncertainty Information especially this A Short Course on Spectral Theory (Graduate Texts in Mathematics) book as this book offers you rich data and knowledge. Of course the information in this book hundred per-cent guarantees there is no doubt in it you may already know.

Merry Springs:

Hey guys, do you desires to finds a new book you just read? May be the book with the name A Short Course on Spectral Theory (Graduate Texts in Mathematics) suitable to you? Often the book was written by famous writer in this era. The actual book untitled A Short Course on Spectral Theory (Graduate Texts in Mathematics) is the one of several books this everyone read now. That book was inspired a lot of people in the world. When you read this guide you will enter the new way of measuring that you ever know prior to. The author explained their thought in the simple way, and so all of people can easily to understand the core of this guide. This book will give you a large amount of information about this world now. In order to see the represented of the world in this particular book.

Jacqueline Carter:

The reason why? Because this A Short Course on Spectral Theory (Graduate Texts in Mathematics) is an unordinary book that the inside of the e-book waiting for you to snap it but latter it will shock you with the secret this inside. Reading this book close to it was fantastic author who have write the book in such amazing way makes the content within easier to understand, entertaining technique but still convey the meaning totally. So , it is good for you for not hesitating having this any more or you going to regret it. This amazing book will give you a lot of positive aspects than the other book get such as help improving your ability and your critical thinking technique. So , still want to hesitate having that book? If I ended up you I will go to the book store hurriedly.
